Updated Recommendations for Tuberculosis Screening, Testing, and Treatment of U.S. Health Care Personnel
June 13, 2019

Key Messages and Action Steps:

- On May 17, 2019 the National Tuberculosis Controllers Association (NTCA) and CDC issued updated recommendations for tuberculosis (TB) screening, testing, and treatment of U.S. Health care personnel (HCP)* which include the following key points:
  - Baseline (preplacement) TB screening with an individual risk assessment and symptom evaluation
  - Baseline (preplacement) TB testing with an interferon-gamma release assay (IGRA) or a tuberculin skin test (TST) for persons without documented prior TB disease or latent TB infection (LTBI)
  - No routine serial TB testing at any interval after baseline in the absence of a known exposure or ongoing transmission
  - Strong encouragement of treatment for all HCP with untreated LTBI, unless medically contraindicated
- CDPH endorses these updated recommendations and encourages health care facilities to develop internal processes and/or linkages to external partners for LTBI treatment for their HCP.
- The CDPH TB clinic has limited capacity and is unable to accept most referrals for LTBI treatment at this time.

*All other aspects of the Guidelines for Preventing the Transmission of Mycobacterium tuberculosis in Health-Care Settings, 2005 remain in effect, including facility risk assessments to help guide infection control policies and procedures.

Background: TB rates in the United States and Chicago have declined substantially over the past two decades. A systematic review (detailed in the updated recommendations) suggests that U.S. HCP may no longer be at increased risk for LTBI and TB disease from occupational exposures. Routine serial testing of U.S. HCP consumes resources with little detection of TB test conversions indicative of health care transmission. Increasing LTBI treatment among HCP might further decrease TB transmission in health care settings.

Recommendations: In addition to those listed in the box above, all HCP should receive TB education on an annual basis. HCP with a newly positive test result should undergo symptom evaluation and chest radiograph to assess for TB disease. Additional workup might be indicated based on those results. HCP with prior positive TB test and documented normal chest radiograph do not require a repeat radiograph unless they are symptomatic or starting LTBI treatment. HCP who do not complete LTBI treatment should be monitored with annual symptom evaluation to detect early evidence of TB disease.
